

I want to tell you about the mechanism of work of fluorescent trees. Our product - Fluorescent trees, are memory trees. These trees show and tell you about the ongoing actions in the war associated with certain soldiers, whose biographies are also voiced by the trees. The concept of these trees allows us not to use electricity, but to use sunlight, which subsequently is the source of work for our product. We want to make a difference to our planet, since solar energy represents a renewable energy source and is "environmentally friendly", that is, not producing harmful waste during the active phase of use. Therefore, our trees begin to work in the warm season and only in the dark, that is, in the evening and at night. Thus, we believe that such an exposition can attract more attention with its unusual appearance and non-standard time.

Fluorescent trees do not shine very much, only after your palm touches the tree, they begin to show their color in all colors. There is a special prominent place on the tree where to put your palm. Once you have done this, the tree begins to work, as it feels your warmth. Immediately after turning on, a special tripod, with the screen attached, extends from the tree. At the very bottom of the tree, in its trunk, there is a projector. The projector starts working and displays a silhouette on the screen, an image of a certain soldier participating in the war. This silhouette of a certain soldier begins to spin around its axis. Thus, we will be able to observe the military uniform, which the depicted soldier is wearing, and listen to his biography from audio accompaniment with a built-in speaker. After the biography, you can listen to the description of military scenes.
